News Desk

Timex sit-in over cuts

OVER 100 workers at Timex's Dundee plant have begun a sit-in following the announcement of plans to make 200 compulsory redundancies.

The sit-in began after work finished at the company's Milton works last Friday — immediately before the plant's week long Easter holiday.

In January, Timex announced its intention to cut the workforce at Dundee by 1,900. So far, 1,700 employees have taken voluntary redundancy.

Milton is one of two Timex plants in Dundee and is the proposed site for manufacture of the Sinclair flat-screen tv. Sinclair computers are made at Camberdown, which has so far been unaffected by the industrial action.

Timex has already established a pilot production line at Milton for the £50 tv, due to be launched in the autumn.

"It is all a little unreal at the moment, because if they weren't sitting in they would be on holiday," commented a Sinclair spokesman. "A lot de-

BBC disc snags!

ACORN'S BBC disc drives look like running into trouble.

The main chip used in the disc interface unit — the Intel 8271 — is now in very short supply. This in turn is limiting production of the interface itself.

Many Acorn dealers now have no disc interfaces to sell and schools are experiencing lengthening delivery times for the disc drive units.

"World-wide demand for the 8271 chip has gone through the roof," said an Intel spokesman.

"We are out of stock

ourselves and not even Intel in the States can supply any. And the situation is not likely to improve until at least the middle of the year."

A further complication is that it is not clear for how long Intel will continue to manufacture the chip. The 8271 disc controller device has now been on sale for over three years and has been superseded by other chips, such as the Intel 8272.

Colin Malone of BBC Enterprises commented: "I am certainly aware that there has

How to submit articles

Articles which are submitted for publication should not be more than 3,000 words long. The articles, and any accompanying programs, should be original. It is breaking the law of copyright to copy programs out of other magazines and submit them here — so please do not be tempted.

All submissions should be typed and a double space should be left between each line. Please leave wide margins.

Programs should, whenever possible, be computer printed.

We cannot guarantee to return every submitted article or program, so please keep a copy. If you want to have your program returned you must include a stamped, addressed envelope.

Accuracy

Popular Computing Weekly cannot accept any responsibility for any errors in programs we publish, although we will always try our best to make sure programs work.

Editorial

The Software Centre's Buy 'n Try scheme (*Popular Computing Weekly*, 24-30 March) has been the subject of some controversy in recent weeks.

Proponents of the scheme — under which customers can return programs within one month of sale and receive a discount of 80 percent towards subsequent purchases — argue that it will benefit both the consumer and the software industry by increasing overall sales. Those opposed to the Software Centre plan fear that it will damage the industry, making it uneconomic to produce new games.

Legal action over the scheme by Quicksilver has been dropped in return for certain safeguards, including a reduction in the buy-back time from six months to one month. Other software houses opposed to the Buy 'n Try scheme appear to have accepted that they have no legal grounds for stopping it.

Most software companies seem to be adopting a 'Wait and see' approach, although some firms, such as Commodore, are actively looking for alternatives, including moving into Rom software. Other companies are reviewing their conditions of sale.

Early indications are that the Software Centre has been extremely busy since it first opened last month. Like it or not, it appears that we will have to learn to live with the Buy 'n Try scheme — it is not going to disappear.

Continued from page 1

been some criticism of Acorn for using a chip that is coming to the end of its life-cycle."

If Intel were to stop manufacture of the device one solution would be for Acorn to persuade the company to produce a special run of the chip, specifically for use in the BBC machine. Such a move would put up the unit-cost of the chip quite considerably.

Although Acorn's joint Managing Director, Hermann Hauser commented: "We do not see delivery of the 8271 chip causing any production problems at this time," this is not entirely borne out by

shortfalls at the dealers.

Acorn's David Bell, in charge of BBC liaison, said: "There are some concerns with regard to the supply of the 8271." However, he was confident that any price increase in the chip from Intel would not affect the fixed price to the consumer of £97.

"Obviously we are looking at alternative chips — we are doing that all the time," he said.

"But all of the other disc controller chips — including the Intel 8272 — have substantially different operating systems. Any change to an 8272 would require a substantial reconfiguration of the surrounding circuitry.

"I think that we would be reluctant to do that — it would pose problems of compatibility with the existing system."

Meanwhile it looks as if those wanting to buy the disc interface are in for a long wait — at least until June.

Timex sit-in

Continued from page 1

pends on how the action develops when the other workers return after the holiday.

"At this stage, it is most unlikely that computer production will be affected. But, if the action at the Milton plant continues, then it will progressively put back our plans for the tv which are now at a fairly crucial stage."

● IF you reckon you have a "dazzling" career record — including management success in the electronics business — then Clive Sinclair is offering an exciting new job opportunity.

He is looking for an "exceptional" person to become the managing director of a new company that will launch his £50 flat-screen tv in the autumn.

Cambridge Recruitment Consultants, who have been given the task of finding such a candidate, describe the new post as "the job of a decade". The successful applicant will probably be under 45 and will be looking for a salary of at least £40,000 pa.

Lack of response cancels show

THE Scottish Personal Computer World Show, planned for the end of April, has been cancelled.

Lack of exhibitor response was blamed for the decision to abandon the exhibition which was to have been held on April 16-18 at the MacRobert Pavilion, Ingleston, Edinburgh.

Happy hols!

WITH the warm weather almost here, now is the time to plan your computer holiday.

Two companies offer such an experience — Dolphin Activity Holidays and Beaumont Summer Camps. Both offer either residential or day camps between July and September. Prices vary from around £90 for a week at a day camp to between £120 and £160 for a week with full board. Dolphin use Sinclair, Acorn and Apple machines, and Beaumont use predominantly Commodore computers.

More details from Dolphin, 68 Churchway, London NW1 and Beaumont, 73 Upper Richmond Road, London SW15.

Digitised Images

MICROEYE is a new low-cost vision analysis device that can be used with a range of microcomputers.

The package, developed by

Digiturst, enables pre-recorded images from a conventional video recorder to be digitised and transferred to a microcomputer.

At present the device is configured for use with the BBC Model B machine, but it can also be connected to Commodore, Apple, Research Machines, Hewlett Packard and IBM computers.

Pictures are digitised with a 256 × 256 resolution. Although, in the BBC implementation, only a 128 × 128 pixel format is used, the extra

resolution could be extracted using a second processor.

Microeye is supplied complete with the necessary interfaces and cables from the video recorder to the computer. Software included allows the captured image to be dumped to a printer or disc. Images dumped on to disc can then be retrieved for further processing.

The complete package will sell for only £340 including VAT. Contact Digiturst, Leaden Hill, Orwell, Royston, Herts.

Textet changes hands again!

THE future of the Textet TX8000 £98 colour computer is still to be decided after a change of ownership.

The original Textet company, Textet Ltd, was put in the hands of the receiver three weeks ago and all the assets of the company have been acquired by a new company, Text Sales Ltd, set up by Hira Ltd, a Manchester-based import/export company.

Peter Richardson, one of two partners who set up the original Textet company, has been retained by the new owners as managing director of Textet Sales.

The original Textet company negotiated an exclusive UK distribution agreement with

the computer's Hong Kong manufacturers, Video Technology.

The 8K TX8000 is only one of a range of computers being produced by Video Technology — 4K and 16K machines are also being manufactured.

Atari agrees with Visicalc

IN a new series of licencing agreements, Atari has reached agreement with the Visicalc corporation to put a version of the Visicalc word processing package on to the Atari 800 and 1200XL machines.

In a separate agreement, Atari has licenced Logo for the two machines.

Recalled recorders

ACORN has had to recall 3,600 cassette recorders supplied with its machines under the Department of Industry's Micros in Primaries scheme.

Pressing the Play or Rewind button on the BBC Data Recorder while a program was being loaded produced a 'click' on the tape. This was often sufficient to cause the program to crash.

The machines, made in Hong Kong for Acorn, are now being replaced with modified units. Recorders with the design improvement can be identified because they have a white paint spot on the underneath of the casing.

Bogus rumours

I wish to quell the recent incorrect rumours about the launch of the Sinclair Microdrives. When the Spectrum was launched in April last year, the Microdrives were said to be 'coming soon'. Then they were to be available 'at the end of the year' (1982), and now it is claimed 'in the early part of 1983'. These are all, of course, not true.

A contact working for Sinclair tells me that 'maybe' there will be a few ready for magazine reviews by 'about June' — there will obviously be none available to us Spectrum owners for at least another month from then, not including the statutory two-month waiting time for all new Sinclair products!

The Advertising Standards Authority should again be contacted about Sinclair's advertisements, not only for the 'coming soon' Microdrives but also because they still claim 256×192 pixels, when only 256×176 are addressable from Basic.

Staffs ST13 8DL

Do's and don'ts

In addition to P Finn's comments on copyright (*Popular Computing Weekly*, April 7-13), which I am in full agreement with, I would like to offer this advice to all purchasers (potential or otherwise) of compilers.

- 1) *Potential purchasers*
If you are considering purchasing a compiler for your micro please ensure that the product for sale is:
— Not purely a naive converter
— can handle all Basic functions available on your micro
— not integer based

It is my opinion that no such compiler currently exists for the Spectrum and those that are for sale fall far short of the "basics" stated above.

- 2) *Purchasers*
If you have purchased a compiler, do not, I repeat, do not be fooled into thinking you must pay the company you purchased the compiler from any kind of royalty.

It is not enough that you have paid the company money in return for a product, that you are now told the you must pay further monies should you wish to market your own developed software? Sheer greed and stupidity on the company's part I would say.

No doubt my comments will upset a few companies — alternatively it might bring them to their senses. However, let me state now that should I develop software and subsequently market the same and if during 'my hard work' I used such tools as a compiler, then under no circumstances will I pay or recognise any form of royalty. If that upsets you, "Mr Company", then I am more than willing to fight.

So come on all you companies out there, let's try to put some professionalism into the micro industry and take out any sharp practices.

Acorn is very much in business. Unfortunately, like many other micro manufacturers, Acorn does not always answer its correspondence promptly. If you cannot get any reply to your letters, I would suggest telephoning Acorn direct.

Gobbling up space!

Now that we have micros like the Dragon 32 offer-

ing us a good amount of user Ram for a fair price, it appears that people are very keen on gobbling up as much space as they can without a thought to how inefficient their programs might be. A good example is a program called *Board Game* published in *Popular Computing Weekly*, 27 January-2 February. Lines 550 to 740 read:

```
550 AS = INKEY$
560 IF AS = "X" THEN 10
570 IF AS = "1" THEN C = 25:F1 = 1
580 IF AS = "2" THEN C = 45:F1 = 1
590 IF AS = "3" THEN C = 65:F1 = 1
600 IF AS = "4" THEN C = 85:F1 = 1
610 IF AS = "5" THEN C = 105:F1 = 1
620 IF AS = "6" THEN C = 125:F1 = 1
630 IF AS = "7" THEN C = 145:F1 = 1
640 IF AS = "A" THEN D = 25:F2 = 1
650 IF AS = "B" THEN D = 45:F2 = 1
660 IF AS = "C" THEN D = 65:F2 = 1
670 IF AS = "D" THEN D = 85:F2 = 1
680 IF AS = "E" THEN D = 105:F2 = 1
690 IF AS = "F" THEN D = 125:F2 = 1
700 IF AS = "G" THEN D = 145:F2 = 1
710 IF AS = "H" THEN D = 165:F2 = 1
720 IF AS = "I" THEN D = 185:F2 = 1
730 IF AS = "J" THEN D = 205:F2 = 1
740 IF AS = "K" THEN D = 225:F2 = 1
```

By using a simple table, the 18 (!) conditional statements could be replaced with the following:

```
550 AS = INKEY$:IF AS = "" THEN 550
560 IF AS = "X" THEN 10
570 IF ASC(AS) > 48 AND ASC(AS) < 56 THEN C = TABLE(ASC(AS)):F1 = 1
580 IF ASC(AS) > 64 AND ASC(AS) < 76 THEN D = TABLE(ASC(AS)):F2 = 1
```

The only extra code required is to initialise the table at the beginning of a run. This could appear as a subroutine:

```
1000 DIM TABLE(75)
1010 DATA 25,45,65,85,105,125,145,165,185,205,225
1020 FOR A = 49 TO 55:READ TABLE(A):NEXT:RESTORE
1030 FOR A = 65 TO 75:READ TABLE(A):NEXT
1040 RETURN
```

This makes much more efficient use of both the interpreter and processor. Of course, this is not the only use for tables, but I hope it has given an insight into how the problem of testing for many conditions may be solved.

MICROL[®]

SERIOUS SPECTRUM SOFTWARE only £9.95 each!

USE AND LEARN

Your perfect Spectrum starter Kit. 25 original BASIC programs you can use immediately, PLUS 118 page manual to help you get the most from your 16or48K Spectrum. 25 programs include: Music Composer, World Atlas, Computer Term Glossary, Screen Designer, Star Maps – PLUS games and powerful routines to use in your own programs: graph-drawing, text-editing, sorting, searching and much more. 118 page manual includes detailed description of programming techniques, full listings of all programs, and articles to develop your own program-writing skills.

"Excellent" A.R. West, Surrey. "First-time loading, user-friendly, superb documentation" J.E. Mann, Leeds.

THE DATABASE

Whether you want to update mailing lists, manage customer accounts, or simply produce an index of your record collection, THE DATABASE makes it easy and enjoyable. A breakthrough in power and practicality, THE DATABASE allows you to store information on any subject in the way you want, and gives you a full range of commands to display, update, sort, search and print – even perform calculations. Massive storage capacity: 1,000 lines in memory at a time, over 7,000 names and addresses on a single C90 cassette. See for yourself why THE DATABASE is the most advanced 48K Spectrum database available – far more powerful and practical than Sinclair's VU-FILE and all other "competitors".

THE SPREADSHEET

Based closely on Visicalc, the world's best-selling program, THE SPREADSHEET turns your 48K Spectrum into a "super-Calculator" that helps you solve all kinds of number-based problems quickly and easily. Hundreds of applications in business, engineering and science – and just as versatile for home finance management. Invaluable in education too, helping develop maths ability and confidence. In power, flexibility and ease of use, THE SPREADSHEET outperforms all other Spectrum spreadsheets – including Sinclair's VU-CALC. See for yourself, with the security of MICROL'S 14 day money-back Guarantee.

THE WORD PROCESSOR

The only full feature, professionally-written word processor for 48K Spectrums. Use it to produce memos, letters, reports – THE WORD PROCESSOR has the features you need, including flexible editing, justification, centering, and automatic "word wrap". Simplicity itself to use, THE WORD PROCESSOR uses the same "what you see is what you get" principle as word processors costing hundreds of pounds more. 20,000 character storage capability for real-work applications, and it's easily adapted to work with full size printers. Once again, MICROL sets the standard in serious Spectrum software.

To order: (UK Orders Only). Simply complete the coupon, and FREEPOST with your cheque, made payable to MICROL (UK Mail Order). All products normally available from stock and despatched by return. Credit Card Orders: By phone 9-5.30 Mon to Fri. stating name and address, Card No. and item(s) required.

Defender

A new game for the 48K Spectrum by Michael Levers

This program for the 48K Spectrum, is structured so as to make the game run as fast as possible. The main loop is located as near to the start of the program as possible so that *Gotos* and *Gosubs* are executed without delay. All 'trivial' routines, such as the instructions and skill level selection, are placed at the end of the program as these do not require fast moving graphics.

When readers are typing in the program, they may like to replace *Inks* and *Papers* with the corresponding *Control Characters*, as this will also speed up the program.

A detailed break-down of each subroutine follows:

Line(s)

110 Calls subroutine at 9500 which sets up characters etc.

120 Calls subroutine at 9000 which prints instructions.

130 Calls subroutine at 8000 which allows the player to enter his or her skill level.

140 Calls subroutine at 7000 which sets up initial score/position variables.

150 Calls subroutine at 6000 which prints the screen — score/lives/ships etc.

160 Calls subroutine at 5000 which plays an introductory tune.

170 Calls subroutine at 1000 — the main loop.

180 Calls subroutine at 4000 which tells the player that the game is over and updates high scores accordingly.

190 Tells the computer to repeat the whole process — (130-180).

500-590 Sets up variables to do with alien: LA = position across screen, LD = position down screen, AI = decrement for alien's horizontal position (this determines the speed at which it moves across the screen), DI = increment/decrement for alien's vertical position (this is chosen randomly from array D) which contains all possible increments/decrements).

1000-1900 The game itself:

1010 Calls alien variable subroutine and prints alien at its start position.

1100 ERASES DEFENDER from its previous position and prints it at its new one. C\$() contains the 2 possible images of the ship — changing C from 0 to 1 alternately gives the "flickering engine" graphics. Scans keyboard — if fire button pressed and the alien is in front of you then a "laser bolt" is printed in front of your ship and then erased — if your position is the same as the alien's (down the screen) then a graphics subroutine is called.

1110 Creates a random number — if this is less than your skill level divided by ten and the alien is in front of you then a "laser bolt" is printed in front of the alien — essentially the lander is firing at you. The bolt is then erased and if the alien's vertical position is the same as yours then a graphics subroutine is called which simulates the explosion of your ship. The computer then

branches to the appropriate line (contained in NEXT).

1120 Stores current position of ship and increments/decrements it according to key pressed. Also makes sure ship does not go off the screen.

1125 "Wraps around" landscape variables AS and BS giving the effect of Forward Motion. Prints these at the bottom of the display.

1130 Erases old position of alien and decrements its position across the screen; if this is less than zero then a human is taken and control branches to line 1200.

1140 Checks to see if new vertical position of alien is off the screen — if so changes sign of down increment.

1150 Prints alien at its new position, creates a random number — if this is less than 0.3 then the alien's down increment is changed.

1155 Checks to see if ship and alien occupy same position — if so then calls a graphics subroutine for the explosion of your ship. Repeats main loop from 1100 onwards.

1160 Decrements number of humans — if no more left calls a graphics subroutine for the explosion of your planet. Transfers control to line 1900.

1200 Repeats main loop from 1000 onwards.

1210 Returns control to the control loop at the start of the program.

1900 Subroutine which produces flashing effects for when all the humans are taken.

2000-2490 Graphics for the explosion of an alien.

2510-2520 Increments score — increment is proportional to the number of aliens you have shot so far. Prints score.

2530 Increments number of aliens shot. If this is a multiple of ten then the skill level is increased by one.

2540 Returns control to main loop.

2900 Produces an explosion effect for when you are shot by an alien.

3010-3060 Decrements number of ships and calls a routine to print the number remaining.

3070 If your lives have run out then sets NEXT equal to 1900 (a line number) and returns control to main loop.

3080 Calls variables/screen/tune routines and returns control to main loop.

3090-3900 Informs player that game has finished.

4010-4020 Clears screen and checks to see if a high score has been achieved — if not then transfers control to line 4200.

4030 Informs player that he has achieved a high score.

4035-4100 Sets the attributes of the bottom two lines of the screen to INK White, PAPER black and extra BRIGHT. Allows player to enter his or her name — checks to see that it is not too long or short.

4110 Updates high score table.

4120 Prints the table of high scores.

4200-4290 Makes the word "DEFENDER" flash in different colours.

4300-4310 Waits for a second then prints a copyright message.

4320 Prints on the last line of the screen (using # 0). Asks player if he wants another game.

4330 Waits until either the "Y" key is pressed or the "N" key is pressed.

4340 Sends control to 4900 if "Y" key pressed.

4350 Pokes system variable ATTR P with attributes of screen, sets border colour and

clears screen.

4360-4380 Thanks user for playing and informs that the program is about to NEW itself.

4390 Prints numbers from 99 to 0.

4400 Calls Rom routine equivalent to NEW.

4900 Returns to control loop.

5000-5040 Plays a little tune to inform user that game is about to begin.

5900 Returns to control loop.

6010 Pokes system variable ATTR P with attributes of screen, sets border colour, clear screen.

6020-6030 Draws a box at the top of the display — blue paper, white ink.

6040-6050 Prints score, number of ships left and number of humans left in box.

6060 Prints landscape at base of display.

6070 Calls subroutine to print graphically the number of ships left.

6080 Prints DEFENDER ship at its initial position.

6090 Returns to control loop.

6210 Prints graphically the number of ships left.

6900 Returns control to correct part of program.

7010-7020 Creates landscape variables AS and BS.

7030 Creates array CS which holds the two images of the DEFENDER ship including its attributes — CHR\$ 16 etc.

7100-7200 Initialises main score/position variables: C = (number of ship to be printed) - 1, SC = score, LIVES = number of ships left, HUMANS = number of humans remaining, NA = number of aliens destroyed, SD = present verticle position of DEFENDER ship, OSD = old vertical position of ship. Returns control to appropriate part of program.

7900 Pokes system variable ATTR P with attributes of screen, sets border, clears screen.

8010 Asks player to choose a skill level.

8020-8040 Calls variables subroutine.

8050 Checks to see if a key between 1 and 5 has been pressed — if not prints landscape and moves it to the left.

8060 Sets SK (skill level) to the value of the key pressed divided by ten. Sets SSK equal to SK times ten.

8070 Returns control to control loop.

8900 Prints the name of the program in large letters and prints its author.

9010-9110 Prints the instructions at reading speed.

9120-9180 Waits until ENTER is pressed.

9190 Returns to control loop.

9490 Sets attributes of screen and asks user to wait while the user defined graphics/character set are created.

9510-9530 Pokes system variable CHARS with 256 less than the address of the new character set data.

9540 Copies the data for the normal character set from Rom into Ram (above RAMTOP).

9550 Pokes the data for the "space-age" character set into place, overwriting the similar character set in Ram.

9560-9570 Pokes in the user defined graphics — aliens, DEFENDER etc.

9580 Data for new character set and user defined graphics.

9600-9880 Creates high score table.

9970 Pokes system variable FLAG2 this turns CAPS SHIFT on.

9980 Creates direction array — contains all directions for aliens.

9990 Returns control to control loop.

DEFENDER

ADVENTURES WITH OVER 4000 LOCATIONS

SPACE ADVENTURE ROLE PLAYING ADVENTURE SINGLE PLAYER ADVENTURE

Over 4000 locations on one adventure cannot be done on one tape! The first tape contains the graphics, the instructions, the preparation for travel and the first adventure. As soon as this first adventure is finished you can order the next part. You can stop the game any time you like.

TYRANT OF GRAHIM: an adventure in outer space. Try and find your way to the planet Shrahaim. The approaches are heavily guarded but if you can get through you will find eternal life and the conquest of the universe is yours. Maybe (but we doubt it) you will find the way to another universe, but only if you enter the right black hole...

TREASURES OF MOSHT: a single player adventure in the most fabulous country ever put on computer. Try and stay alive in a place where everything seems to go against you...

TRAVELS IN RASHAN: a role playing adventure situated on earth before the cataclysms which happened before the Precambrian era, some 600 million years ago. Travel through this ancient civilisation with its uncanny laws, stay alive and gather treasure. Then try and get back to your own time...

EACH ADVENTURE, Module 1, £4.50
Each further module also £4.50

WAR GAMES:

CRUSADE: an imaginary crusade taking you through the campaign stage, several battles and finally a siege. Try and be as cunning as our medieval forebears...

TRENCHES: there are two lines of opposing trenches. The arms are those used during the first world war. Relying on artillery, intelligence and strategy you must try to break through your opponent's line. The positions change every time you play it!

THIS COULD BE YOUR LIFE: you decide upon a series of parameters which constitute your attitudes in life (religion, education, qualifications, etc...) Then one year of your life will be re-enacted and you make the decisions. See what you make of it this time...

THE MURDER OF ROWAN WILSON: a new concept of whodunnit on computer. You will have to find the murderer by sifting through information on twelve suspects. A highly complex game, in which the criminal changes every time you play it again. Also all the data change, so you never 'know it' or get bored. More than twelve solutions...

All games £4.50

Please add 50p per order for p&p

Available now for Spectrum 16K/48K and Atari 400/800
Available in May for Dragon and Oric-1

EVOLUTION (48K Spectrum)

Can you: Trace the course of evolution?
Start with primeval soup & end up with man?
Survive the odd major disaster?
Should be easy... after all it's been done before!

Only £6.95

OMNICALC (48K Spectrum)

The best spreadsheet analysis program you can buy for the Spectrum. Uses include financial planning, home budgets etc.

Features: 99 columns or 250 rows
Fully prompted input
Extensive repeat facilities
Conditional expressions and RND
Totalling and sub-totalling
Comprehensive manual

£9.95

ZX-SIDEPRINT (For Spectrum or ZX81)

Print sideways on the ZX-Printer to give proper 80/132 etc character print lines.

Easy to add to existing programs
Routines to take print lines direct from screen
Lower case letters even on a ZX81!

(State version req'd) £4.95

CREVASSE & HOTFOOT (16K Spectrum)

2 original games from Microsphere

Can you make it across the ice-cap whilst chasms open and close all around?

Help the rabbit get to fields full of carrots - but remember: the plumper the rabbit, the greater the danger.

Excellent value £4.95

THE CHEAPEST KNOWN RAMPACKS IN THE WORLD

Financial wizards . . .

Tony Bridge takes a look at the range of Spectrum programs available for small businesses

By its very nature, the Spectrum is not a business machine. If your particular interest in using a micro is to help a company of 200 employees or more, you can safely move on and up a couple of thousand pounds.

The Microdrive, when it finally appears (soon, soon, say Sinclair) will enable the Spectrum to be used properly by businesses, but until then the machine is really only of use to the very small business. And for small business applications, there are myriad programs.

One of the most successful is *Visicalc*, which has become a generic title for financial "spreadsheet" programs. The term is a good indication of what these programs actually do.

Imagine you are the owner of a small restaurant. You know that if you spend a certain amount on food each week you can make so many meals, and thus earn so much money. What happens if you were to spend another £20 on your weekly spree? How many more meals would you be able to prepare, and thus how much more revenue would you create? What would be the result of extending your premises to include another 10 tables?

You could, of course, just get a piece of paper and a pencil, and write all the figures down. Being a Spectrum owner, however, there is another course open to you, and that is to *Load* into your computer a spreadsheet program. This will, after some initial setting-up, produce a picture of all the effects on your original model of varying figures.

The Spectrum is well-served in this area — Sinclair, with the aid of Psion, have a spreadsheet package on the market, in competition with several others. How do they all compare?

Psion is well-known now as the producer of the Spectrum demonstration tape *Horizons* and *Hungry Horace*, *Flight*

Simulation, etc. *Vu-Calcul* is its contribution to the financial software scene, and comes with detailed documentation, albeit only on the cassette inlay.

Vu-Calcul comes complete with an example which should definitely be looked at before *Loading* the main program. The layout is similar to the mainframe programs; that is, several rows and columns which may be filled with text and numerical data, thus building up a matrix of boxes.

In *Vu-Calcul*'s case, the rows run from A to Z, through AA to AZ and on to BH. The columns are numbered 1 to 60 — these figures are for the 48K machine, they will be less for the smaller machine. You may place text wherever you like within the matrix — a simple example will consist of headings such as Sales, Rent, and Profit along the top of the matrix, and maybe the months of the year making up the rows.

Numerical data may now be input. Only four columns of 18 rows each may be seen on-screen at any one time, but the red cursor which marks your present position may be moved to the edge of the screen, upon which the whole display moves in the desired direction. You can thus cover the whole matrix very quickly.

Once your data has been entered, the real power of a spreadsheet program can be explored. It's no good having all these figures just sitting there doing nothing — the benefit of a program like this is in the manipulation of such data.

The program uses formulae defined by the user to work on the figures. A simple example might be to invoke a formula to add box one to box two, and display the result on box three. In *Vu-Calcul*, this formula can easily be repeated throughout the whole matrix, row by row and column by column.

By moving the cursor around the boxes, the formula relevant to each box is displayed, then one or more of your figures can be

amended, and the result of such an alteration instantly calculated at your command.

I found the program easy to work, but I would have liked a *Help* page at certain moments. As it stands, a short summary of commands is displayed as required, but these are infuriatingly meagre. Also, it is very easy to lose your carefully-typed data, and although one has to select the option to clear the program, I feel that there should be one more chance to return to the data sheet. In the main, however, a useful program.

Running out of memory!

Matcalc comes from Workforce with the usual detailed, Epson'd documentation. This spreadsheet is a little more difficult to use than *Vu-Calcul*, but comes complete with two excellent and informative sets of example data, so that you may see the effects of real figures on the program. Unfortunately, there is no display to start with as in *Vu-Calcul*, and you have to work on entering the data with no visual feedback. It is essential, therefore, to work out your matrix requirements before starting to input data at the keyboard.

Matcalc will ask you for your matrix (row/column) requirements before you start, and there is a distinct advantage here over Psion's fixed grid. In this way, you will not find yourself running out of memory near the end of an exhausting session of entering data.

Once all your figures are in *Matcalc*'s memory, and the formulae set to your requirements, the matrix, complete with data and calculations, is displayed. A choice of 64 numerals per line, or the Spectrum's more usual 32 per line, is available.

Bear in mind that you will have to wait for the display to be printed each time you amend your data. This is where the conventional *Vu-Calcul* scores over *Matcalc* — data can be seen instantly on-screen. However, Workforce's program is far more flexible overall than Psion's.

From Saxon Computing comes *Flexicalc*. Again, the program is accompanied by clear and detailed documentation,

which is a necessity for these financial packages.

Saxon claims that *Flexicalc* is "the most versatile of spreadsheet programs available for the Spectrum". Well, like *Matcalc*, this program will allow you to dictate the size of matrix you wish to work in, and like *Vu-Calc*, formulae may be changed and edited at will.

The section in the documentation referring to the construction of formulae is a lot easier to understand than either of the other two, and is actually a pleasure to read through. The formulae work relatively; the box currently being worked on is always box 000, regardless of its actual position in the matrix. This makes the business of devising formulae much easier than with *Vu-Calc* or *Matcalc*.

The *Copy Across* or *Copy Down* function allows you to repeat formulae across rows or down columns, as in the other two. The display of boxes is at first black on white paper, but you can dictate the colours of the final display.

Although a *Help* menu was present at all stages, I found data manipulation more of a hardship than in the *Vu-Calc* program, even though formulae were a lot easier to handle. The program is not very well idiot-proofed, however, and accidentally pressing the wrong key can prove disastrous — crashes seem to happen at the slightest provocation, although recovering control is not difficult. The calculations were not very fast when compared to Psion's lightning responses.

However, Saxon provides an extremely good after-sales service with *Flexigen*, which formats the whole of your matrix to the printer in such a way that you can cut up the various strips and paste them all together to make up one large report. This comes together with a *Consolidation* program for £6.95. As a complete financial spreadsheet package, the three programs are excellent value.

Microsphere is a newly-formed com-

pany that has a number of interesting-looking programs available. They have graced the spreadsheet world with *Omnicalc*.

As with *Matcalc*, the user specifies his particular requirements for the matrix, dictating the number of rows and columns, before work begins. The manual is by far the best, being written for the completely

computer-naïve, and not assuming prior knowledge of this type of program. A five-page example comes first, and this will take you painlessly through the secrets of *Omnicalc*.

Text and data input is largely the same as the other programs, with the text or figures being displayed in the matrix. There are, however, one or two important differences. First, whenever a function is selected, a letter appears top-left to show you exactly what mode you are currently in. Next, room is allocated around the matrix for text only, such as headings, categories and so on.

Type in *Jan* (for January) at Row 1, then "Y" (for Year), and the computer will instantly respond by filling the labels of the next eleven rows with the remaining months of the year. Of course, you don't have to have months as a label, but that is a frequent requirement for this type of program.

In the borders surrounding the boxes, only text and/or numbers may be written, but move the cursor into a box, and the program will allow text values (ie, straight numeric values), blanks, or equations (or formulae). This is the easiest program of all to use, I feel — not only does the manual contain detailed information on all

the available functions, but formulae are extremely easy to implement. Any mistaken key presses can be recovered from by pressing *Edit*.

Which spreadsheet for you? All the programs under review do their job well, and all have detailed and helpful documentation. However, I found the *Omnicalc* from Microsphere the easiest to work on and become familiar with.

But maybe the spreadsheet idea as implemented in these Calc-type programs is not for you. There are several titles available of a more specific nature. One of these is *Modellerx*, from CCS, otherwise well-known for its management games. The program has two applications — to aid managers in making financial forecasts and thus decisions based on the projections, and secondly, as a training aid for management trainees.

The manual is very detailed and the manipulation of data is similar to the spreadsheets we have already looked at. That is, once the model is set up, the user can see the effect on the whole pattern, by changing just one piece of data.

The first stage is to input various market factors — such as effectiveness of advertising and salesmen, sales targets, market demands, etc., and then the variable data may be introduced.

Worthy of consideration

This data will take the form of advertising costs, showroom and office costs and all the other factors involved in running a financial business. Change one and all the others will be affected in some way. Four models may be set up at one time so that the differences between various sets of data can be compared on screen.

We've seen a spreadsheet from Saxon

Matcalc

Computing, and now we come to their Numeric Database, *Figaro II*. A numeric database is a program to handle large quantities of numeric information. The program will arrange and manipulate the information into meaningful reports. To explain that, look at the example given in the excellent manual.

A chain of three shops acquires a new managing director, who, being very dynamic, asks for a forecast of sales in each shop for the next year, based on the last two years sales, together with a graph of each forecast and a table of the growth rate for each shop.

Once all the sales figures are entered, and this is very easy via an excellent display, graph plotting can begin. Several options are open to the user, such as barcharts, line graphs, or combinations of

the two — and all in full colour hi-res colour graphics.

Unlike many financial programs, I feel, this program is worthy of consideration by the larger business. *Figaro* is completely error-trapped and the microdrive will make it even more useful.

But maybe you do not run a business and would just like to know the state of your own bank account. One of the newer Personal Systems to arrive is from Forest Software. The *Personal Finance System* is "a maintenance of your current account with reconciliation to your bank statement". Up to 250 credit or debit entries are allowed, along with 30 standing orders. The program is fairly straightforward, with prompts all the way to guide you. An interesting point is the facility to see your future bank balance, based on past data. The documentation is only average, but for £4.95, what can you expect.

Richard Shepherd, known mostly for his adventure programs, has produced a program called *Multi-Function Cash Controller*. With this program you can keep track of eight budgets (gas, rent, electricity, etc) and then see, from your actual outgoings, how you have kept within — or overspent! — your budget. The program is fully menu-driven, and will guide you through the whole process.

Another facility keeps track of your bank account, complete with standing orders. As a bonus, there is a routine to take you through the complexities of a loan or mortgage — input any three of the parameters: principle, interest rate, repayment time, units of repayment, and the *Cash Controller* will calculate the fourth parameter for you.

That completes our look at financial packages for the Spectrum. There are obviously many programs available, and there will be many more available in the future — after all, number manipulation is exactly what all computers, small or large, PDP/II or Spectrum, are good at.

Sinclair ZX Spectrum

**16K or 48K RAM...
full-size moving-
key keyboard...
colour and sound...
high-resolution
graphics...**

**From only
£125!**

First, there was the world-beating Sinclair ZX80. The first personal computer for under £100.

Then, the ZX81. With up to 16K RAM available, and the ZX Printer. Giving more power and more flexibility. Together, they've sold over 500,000 so far, to make Sinclair world leaders in personal computing. And the ZX81 remains the ideal low-cost introduction to computing.

Now there's the ZX Spectrum! With up to 48K of RAM. A full-size moving-key keyboard. Vivid colour and sound. High-resolution graphics. And a low price that's unrivalled.

Professional power— personal computer price!

The ZX Spectrum incorporates all the proven features of the ZX81. But its new 16K BASIC ROM dramatically increases your computing power.

You have access to a range of 8 colours for foreground, background and border, together with a sound generator and high-resolution graphics.

You have the facility to support separate data files.

You have a choice of storage capacities (governed by the amount of RAM). 16K of RAM (which you can upgrade later to 48K of RAM) or a massive 48K of RAM.

Yet the price of the Spectrum 16K is an amazing £125! Even the popular 48K version costs only £175!

You may decide to begin with the 16K version. If so, you can still return it later for an upgrade. The cost? Around £60.

Ready to use today, easy to expand tomorrow

Your ZX Spectrum comes with a mains adaptor and all the necessary leads to connect to most cassette recorders and TVs (colour or black and white).

Employing Sinclair BASIC (now used in over 500,000 computers worldwide) the ZX Spectrum comes complete with two manuals which together represent a detailed course in BASIC programming. Whether you're a beginner or a competent programmer, you'll find them both of immense help. Depending on your computer experience, you'll quickly be moving into the colourful world of ZX Spectrum professional-level computing.

There's no need to stop there. The ZX Printer—available now—is fully compatible with the ZX Spectrum. And later this year there will be Microdrives for massive amounts of extra on-line storage, plus an RS232 / network interface board.

Key features of the Sinclair ZX Spectrum

- Full colour—8 colours each for foreground, background and border, plus flashing and brightness-intensity control.
- Sound—BEEP command with variable pitch and duration.
- Massive RAM—16K or 48K.
- Full-size moving-key keyboard—all keys at normal typewriter pitch, with repeat facility on each key.
- High-resolution—256 dots horizontally x 192 vertically, each individually addressable for true high-resolution graphics.
- ASCII character set—with upper- and lower-case characters.
- Teletext-compatible—user software can generate 40 characters per line or other settings.
- High speed LOAD & SAVE—16K in 100 seconds via cassette, with VERIFY & MERGE for programs and separate data files.
- Sinclair 16K extended BASIC—incorporating unique 'one-touch' keyword entry, syntax check, and report codes.

rum

ZX Spectrum software on cassettes—available now

The Spectrum software library is growing every day. Subjects include games, education, and business/household management. Flight Simulation... Chess... Planetoids... History... Inventions... VU-CALC... VU-3D... Club Record Controller... there is something for everyone. And they all make full use of the Spectrum's colour, sound, and graphics capabilities. You'll receive a detailed catalogue with your Spectrum.

ZX Expansion Module

This module incorporates the three functions of Microdrive controller, local area network, and RS232 interface. Connect it to your Spectrum and you can control up to eight Microdrives, communicate with other computers, and drive a wide range of printers.

The potential is enormous, and the module will be available in the early part of 1983 for around £30.

sinclair

Sinclair Research Ltd, Stanhope Road,
Camberley, Surrey GU15 3PS.
Tel: Camberley (0276) 685311.

The ZX Printer—available now

Designed exclusively for use with the Sinclair ZX range of computers, the printer offers ZX Spectrum owners the full ASCII character set—including lower-case characters and high-resolution graphics.

A special feature is COPY which prints out exactly what is on the whole TV screen without the need for further instructions. Printing speed is 50 characters per second, with 32 characters per line and 9 lines per vertical inch.

The ZX Printer connects to the rear of your ZX Spectrum. A roll of paper (65ft long and 4in wide) is supplied, along with full instructions. Further supplies of paper are available in packs of five rolls.

The ZX Microdrive—coming soon

The new Microdrives, designed especially for the ZX Spectrum, are set to change the face of personal computing by providing mass on-line storage.

Each Microdrive can hold up to 100K bytes using a single interchangeable storage medium.

The transfer rate is 16K bytes per second, with an average access time of 3.5 seconds. And you'll be able to connect up to 8 Microdrives to your Spectrum via the ZX Expansion Module.

A remarkable breakthrough at a remarkable price. The Microdrives will be available in the early part of 1983 for around £50.

How to order your ZX Spectrum

BY PHONE—Access, Barclaycard or Trustcard holders can call 01-200 0200 for personal attention 24 hours a day, every day. BY FREEPOST—use the no-stamp needed coupon below. You can pay by cheque, postal order, Access,

Barclaycard or Trustcard.

EITHER WAY—please allow up to 28 days for delivery. And there's a 14-day money-back option, of course. We want you to be satisfied beyond doubt—and we have no doubt that you will be.

To: Sinclair Research, FREEPOST, Camberley, Surrey, GU15 3BR.

Chequed and banked . . .

S Brown presents a personal accounts program for the 16K Spectrum.

I wrote this program for my own needs, as I found it annoying searching through my chequebook stubs to check my account with the bank's monthly statement. With this program the cheques are listed in order, making particular transactions easier to find.

When Run, the program asks for the user's account number (when typing in the program, the user should insert his own number in place of the Xs in lines 60 and 1230 — in line 1240 the Os serve as the bank's area code). If a wrong account number is entered, the program *News* itself after flashing *Incorrect data*. A correct number displays a menu.

The menu allows the user to *Save* on tape, start afresh, debit/credit or display the account. The account is printed like a bank statement with 14 transactions listed. User prompts are at the bottom of the page — asking if the display is to be printed or continued. At the end of the file, a return to the menu is requested.

A particular transaction may be found quickly by giving either the date or details of the transaction. If the transaction is not found, the user is asked to try again or return to the menu. Once found, the transaction is printed at the top of the account display.

Crediting/debiting the account is simple. The user prompts ask for the date, details and amount, which is then printed and checked by the user. If correct, the information goes to up-date the account.

The program also keeps the date and balance part of the display in line; ie, the balance is printed with the decimal points in order.

The program should be easy to convert to other computers — those with a larger

memory than 16K could possibly add other features, such as automatic debiting or standing orders.

Notes

1-5

DIM variables, a\$ stores the date.
t(n,1) stores the amount credited or debited;
t(n,2) stores the balance;
b2 calculates the new balance (starts as zero).

20-40

Sets INK colour and introduces program. INPUT users own account number, if wrong NEWs the program.

50-60

The 'X's are for the user to insert his own account number.

60

Displays the menu.

80-130

Sets variable Z to zero, Z is used during the program so the computer knows which part of the program is being performed (see line 830).

135

Awaits user INPUT.

140-190

Acts as a Mugtrap.

200

Variable P is to check if the screen is full. FOR-NEXT loop using N as the counter.

215

Checks if t(n,1) is zero, if so then there are no more entries left in the file.

220

If line 230 was zero then GOSUB 1270 DRAWS borders around the display.

230

On return from line 240 a user prompt is displayed.

240

GOTO 400 sends the program to ask for user INPUT ie: Printout or menu.

250

Checks if variable P + 14 = N if so then the screen is full.

260

e is set to temporarily store the present balance. In a FOR-NEXT loop each letter in the string is tested to find '.', once found a space is added before the string. This ensures the decimal points are printed in line.

270

PRINTS the files contents ie:
DATE DETAILS DEBIT BALANCE
v\$(n) a\$(n) t(n,1) e\$(n) or t(n,2)

272-278

Sends the computer to DRAW a border around the display.

280

PRINTS a user prompt.

300

Awaits user INPUT.

310

FOR-NEXT loop to clear the display ready for the next part of file display.

400-440

Sets P equal to N to ensure next time round the display has only 14 lines to it.

460-490

Makes printout of the display.

500

Sends the computer back to the user prompt.

520

Menu for displaying particular account.

530

Awaits user INPUT.

550-570

FOR-NEXT loop comparing users date

580-610

640-678

INPUT with memory, once found sends computer to display the account with the particular transaction at the top of the screen.

Performs same task as above but compares Details INPUT.

If Date not found then user prompt displayed.

Awaits user INPUT.

FOR-NEXT loop checking for the last account entry, once found the value of N is where the next transaction can be placed.

User prompt for Date.

FOR-NEXT loop to insert a space if needed before the date to ensure dates are printed in line.

Z is checked to find what part of the program is being performed ie; if greater than zero then the program is working on the section that displays a particular account, from line 540 onwards. If Z = 0 then the account is being credited or debited.

Lets v store the new date.

Checks Z again for above reason.

Lets a store transaction details.

User prompt.

Awaits user INPUT.

SS stores INPUT from INKEYS answer.

User prompt.

Amount debited/credited INPUTted and stored in t(n,1).

Mugtrap.

Calculates new balance, from value of old balance b2.

Stores new balance in t(n,2).

Displays new information INPUTted.

User prompt.

Awaits user INPUT.

If the information displayed was incorrect then the balance is adjusted to read as before and the computer sent to line 780 for the user to reINPUT the information.

User prompts.

The 'X's are for the user to insert his own account number.

The 'O's are to insert the bank's area code number.

Displays the accounts heading.

Sets INK colour to green.

DRAWS boundaries around the display.

User prompt for tape storage.

INPUT for file name storing it in e\$

Check length of string.

User instruction.

SAVES program and the line number from which the program will RUN when re-loaded.

User prompt.

VERIFYS program.

User prompts.

Resets variables by RUNNING the program.

SPECTROGRAPHICS

for ZX Spectrum (48K)
price £6.90 including Manual

Enables you to exploit the Spectrum's superb graphics potential to the full. Eleven graphics procedures in a single user-friendly program. Hi-res and lo-res sketchpads, eight sizes of text, a mini-text editor, colour WASH and PAINT, etc. Create your own UDG characters in a 4 x 2 array. SAVE your display on tape or PRINT on ZX Printer. ReLOAD displays for editing or updating. Etc. etc!

BUSINESSMEN — use SPECTROGRAPHICS to prepare point-of-sale adverts.

TEACHERS — prepare lesson illustrations at home to show your pupils at school.

GAMES ENTHUSIASTS — design invaders, monsters, backgrounds etc. to LOAD into your latest game.

GRAPHIC ARTISTS — turn your Spectrum into a colour graphic sketchpad.

EVERYONE — have fun with SPECTROGRAPHICS!

Send s.a.e. for further details.
From leading computer stores or by mail order.
Prices all-inclusive. Full money-back guarantee.

Screened for action!

James Brennan shows how to obtain a printed copy of the Vic20's Hi-res screen

This program is a subroutine to produce a printed copy of the Hi-res graphics screen. The graphics should be completed before calling up the subroutine.

The super expander cartridge is used for the Hi-res graphics, and to help in the program with these two commands: *Rdot* — used to obtain the colour value of a dot on the screen, and is then compared with the background colour to see if it is part of a line. *Rcolr* — used to Read the colour

contained in the colour register. *Rcolr*(0) — background colour.

The graphics screen is a matrix of 1024 by 1024 pixels. This program divides these pixels into blocks 28 by 28, which represent the printer head matrix of 7 by 7. Each block is then subdivided into columns 4 pixels wide.

Each column is looked at 4 pixels at a time, and if the colour value is not the same as the background, then its binary value is calculated. The final column value (+128) is then placed in a string array using *Chr*\$, until the whole block has been read. It is then programmed into the printer.

The main program is suitable for graphs, etc, but because it prints out a square copy it distorts circles, etc. The three amendments to the program allow circles to be printed out correctly. They take into account the 70 per cent adjustment used when drawing circles.

Notes

- 10020 Open printer channel.
- 10060 Divide matrix into blocks 28 by 28.
- 10100 Divide blocks into rows 4 deep.
- 10120 Divide rows into columns 4 wide.
- 10130 Read colour value of each unit.
- 10150 Compare colour with screen colour.
- 10170 Calculating binary value.
- 10200 Program into printer head.
- 10220 Print out character **.
- 10240 Return at end of line.
- 10260 Close printer channel.

NB. The printer prints out in bursts because it only prints when the data buffer is full.

A random sample. . .

Boris Allan presents a program to assist in the sampling of distributions and the drawing of histograms

In statistics, one of the most important items we have to learn is that of sampling distributions. In the presentation of statistics, one of the most important items is that of the drawing of histograms. *Stanorm* tries to assist in both these areas.

The Central Limit Theorem effectively states that (providing there are sufficient) the adding of random values will produce a normal distributed value. As the mean is little more than the summation of random values (which is why we have *random* sampling), this is why the mean is taken to have a normal distribution (ie, a sampling distribution which is 'Normal' or Gaussian).

The Law of Large Numbers tells us that the greater the number of summed values we examine, the closer the resulting distribution will be to the ideal (of a normal distribution). This program allows these views to be examined.

The accuracy of the Central Limit Theorem is checked via function *Fnnormal* (x): six random values (from 0 to 1) are added to the constant 6, and six random values (0 to 1) are subtracted (the result is V). I could have added twelve random values, and not bothered with the constant 6, but by inverting half of the random values, randomness is increased. If the Central Limit Theorem is correct, this should produce an almost perfectly normally distributed variable.

The normal variates produced by *Fnnormal* are used in *Procsample* (Num, Cat),

where Num is a parameter which gives the number of quasinormal deviates to be examined, and Cat gives the number of categories into which the values are to be grouped (in array V). Line 510 gets a normal deviate; collects the sum in Mean, and the sum squares in SD; and adds 1 to the number in the correct category of array V (ie, V(J)).

After all the values have been allocated, the size of the largest category is held in V(0) (line 520), and finally the mean and standard deviation are calculated (the mean has the value 6 subtracted). For a perfect normal distribution, the mean should be 0.0 and the standard deviation should be 1.0.

The program splits the screen at line 26 on the screen after the initial information has been requested, partly so that the cursor does not interfere with the display, and mainly so that the mean and deviation can be output under the graphics. This division is accomplished by *Procinitt*.

After setting the foreground colour to 2, and the background to 129 (yellow print, red background, in mode 1), the screen is cleared. The size of sample (ie, number of observations) and the total number of categories are then requested, and the text window is set from line 26 on the screen to line 30 (program line 630). If the mode is changed from 1 to 5 (the other four colour mode, and one which can be used for Model A), the

VDU command becomes:

630 VDU 28, 0, 30, 19, 26

and the mode has to be altered in line 210. Though mode 5 does work, the resolution is inferior to that of mode 1, and the effect is not as convincing: in fact, it might be preferable to change *Procfreq* to a dummy procedure.

The actual histogram, and frequency polygon, are produced by *Prochist* (Lower, Upper, Number): where Lower gives the height of the histogram's base (as a Y co-ordinate), and Higher gives the maximum co-ordinate allowed for the histogram; and the third parameter gives the Number of categories (note that this makes *Prochist* quite general, and can be used in other programs).

The histogram is designed to fit between horizontal co-ordinates 39 and 1239, with a bar width (W) of 1200/Number. The base of the histogram is at Lower and the maximum is at Upper.

The bars in the histogram are drawn by *Procbar*, and the frequency polygon is drawn by *Procfreq* (line 700 can be omitted in mode 5). *Procbar* (A,B,C,D) draws bars by changing the graphics window, making the graphics colour 131 (ie, white), and then clearing the window with that colour: thus appearing to draw a bar of white. *Procfreq* plots from the middle of the top of each bar to the middle of the next, and is quite general in use.

★FX 15, 0 clears the input buffer, so that idle doodling does not cause the results to disappear off the screen (in the text window at the bottom); and line 260 merely formats the output of the mean and standard deviation to three decimal places, then resetting the formatter.

Another dimension . . .

Joseph Burr shows how a Spectrum program can be modified to draw 3-D graphics for the Dragon.

Ian Reynolds presented a program to draw 3D graphics on the ZX Spectrum (*Popular Computing Weekly*, 10th September, 1982). The following is a modification of that program for the Dragon 32.

The program draws a three dimensional view of any formula the computer is given to process. The plot is as if the formula was started in the centre of the grid and rotated through the 360 degrees of a circle.

Program notes

Line(s)

50 to 160 These lines set up the grid on which the design is plotted.
170 to 180 This portion of the program holds the picture on the screen until the space bar is pressed.

170 Prevents the screen clearing if the space bar was accidentally pressed.
200 to 380 This section 'moulds' the shape of the formula on to the grid.
220 This line holds the formula to be plotted.
260 and 280 These lines make sure the formula is plotted starting from position 150 down the screen.
290 and 300 These lines prevent the plot leaving the screen limits.

Making up your own formulae

If you wish to experiment the best functions to use are those involving sines (*Sin*) and cosines (*Cos*) of the 'active' variable Q, as these give interesting wave formations. Tans (*Tan*) and exponentials (*Exp*) are more difficult to use, but with careful working interesting shapes from formulae

involving these functions and others (squares (*r2*), square roots (*Sqr*), logs (*Log*), and arctans (*Atn*)) can be written.

If the 'bumps' are too high, divide the original formula by a 'suitable' figure to bring the plot down. If the 'bumps' are too low, the values of Q can be multiplied by a 'suitable' value to increase the height of the plot. These values are best found by experiment. If you wish to invert the display on the screen add a minus sign to the front of the formula.

The program takes between 10 and 20 minutes to draw out the completed diagram depending on the formula in line 220.

Working formulae

$\cos(Q/2)/6$
 $\sin(Q/3) + (Q)/4$
 $\cos(\tan(Q/15) - \sin(Q/2))$
 $-\sin(Q/4)/6$
 $\sin(Q/3) + \cos(Q)/4$
 $(-\exp(Q/3) - \exp(Q))/70$

THE DRAGON DUNGEON

DRAGONWARE

Whenever the Dungeon Master reads of competitors' amazement that the Dragon 32 is selling so well "despite the lack of software", he rolls around the Dungeon floor, overcome by hysterical laughter! Send for our 30-page Dragonsoft Catalogue and find out why.

The Dungeon vaults are fairly bulging with the rush of Dragon software and we now offer the widest selection available in the UK.

Latest Games: 'Donkey King' £8, 'Katerpillar Attack' £8, 'Colorpede' £8, 'Laser Cycles' £6.50, 'Talking Android Attack' £8, 'Cosmic Zap' £8, 'Galactic Ambush' £8.

Latest Books: 'Advanced BASIC for the Dragon' (starts where the manual finishes) £6.95, 'Making the most of your Dragon' £5.95, 'The Dragon Companion' (new printed edition) £4.95.

Latest Utilities: 51 x 24 Screen Cartridge (including graphics "sprites") £25.30, Assembler Cartridge £18.95, 'Telewriter' WP System £49.95, 'Dragon Doodles and Demos' £5.

Coming shortly — Soundbox for monitor users (connect up to your Hi-Fi!).

DRAGON STICKS!

Top quality double
potentiometer joysticks
for the Dragon owner who
demands arcade action
Ultra-sensitive, but tough
and reliable, Dragon
Sticks will keep on
zapping when others fail!
£19.95 per pair
inclusive VAT and postage.

DRAGON CLUB

The Dragon Owners Club at the Dungeon is now the largest in the UK (or, since our members range through Europe to the Gulf and Africa, should we say the world?). Members receive copies of the monthly Club Magazine 'Dragon's Teeth', which includes news, reviews and advice, plus monthly offers and competitions. Win a Year's Free Software or use the Advice Service or members' free advertising. Badges and Bomber Jackets for extrovert Dragon-bashers.

The April edition of 'Dragon's Teeth' is packed with information and, together with the new magazine 'Dragon User', makes essential reading for any serious Dragon owner!

Annual membership (including 'Dragon's Teeth') £6 (£8 overseas) or six-month trial subscription £3.25 (£4.25 overseas).

Partial screen clear

on Spectrum

This is a machine code program for the ZX Spectrum which allows you to clear part of the screen.

Unfortunately, because of the way the Display File is arranged, it is only possible to clear blocks of eight lines, so you can clear the top eight lines, the middle eight

lines, the bottom eight lines or any combination of the three. By altering the second number in the data it is possible to fill the screen. This number is used like the numbers in user definable graphics so if you change the 0 to 255 it will fill the screen with a solid black square.

The Z80 Mnemonics are as follows:

Ld C,0	14,0
Ld HL,"start"	33,0,64
Ld DE,"limit"	17,0,88

As the program stands it will clear the complete screen so to clear part of the screen change the numbers underlined. To clear the top third only change the 88 to 72, to clear the bottom third change the 64 to 80 and to clear the middle third change the 64 to 72 and the 88 to 80.

When you have run the program it should give you the stop report, so to run the machine code enter *Continue* and the screen should fill with a solid black square and then clear.

```

Partial screen clear

Maths

on ZX81

Maths runs on the 16K ZX81 and attempts to teach children in the range of 5-7 years the basic principles of addition and subtraction.

The program is extremely user-friendly and actually sets out each sum as a child of that age would on paper, including carry digits, which the computer is intelligent enough to ignore, and not request, if not necessary in a particular sum.

The program will not set a sum producing a negative number, which would confuse the child, and the sum is set out correctly after he has answered, so that he

can see where he made a mistake. After 10 sums, the child is told how well he did and given the option of more (no, it isn't a stupid question; all the subjects I tested the routine on reached for the Y key).

The sum may be more difficult for an adult to answer than a child, as it employs the techniques a young child would use. (Yes, I do remember as I am only 15 years old.) First the product (or subtractive remainder) of the units column, then the carry digit (the computer will not request one if not necessary) and finally the product of the tens column (likewise, if not necessary, it will not be requested).

Answering is, for the child, simplicity itself, as a cursor (inverse '?') marks the spot where the next particular digit belongs

in the answer. Upon running, this process will be made clear (it is not easy to describe in words).

Program notes

- 50-650 Main program loop
- 80-110 Addition or subtraction sum? Two numbers?
- 120 Does sum produce a negative answer?
- 130-160 Calculates answer and converts numbers and answer to strings
- 180-200 Prints out sum and requests answer
- 250-500 Prints cursor in appropriate place, bug checks and prints Inkeys
- 500-560 Right or wrong?
- 580-600 Prints out correct sum and increments score if necessary
- 620-650 If not last sum, back to start of loop
- 660-770 If last sum, print results and rating
- 750-999 Does pupil want more sums?
- 1000-1130 Introductions subroutine (NS=pupil's name)

Super tables

on Vic20

This program will run on the unex-

panded Vic. It is an educational game for the younger child and will help them learn the full range of multiplication tables.

The program allows you to select which times table you require, gives 40

seconds to learn them, then sets 12 questions for you to answer. Other facilities are question number, number right and number wrong — all accompanied by suitable tunes and colour.

Compart

on Dragon

Compart is a graphics utility used for drawing on the Pmode 3 screen. Full instructions are printed at the beginning, but it is useful to keep a list of commands. The commands are as follows:

↑ Move up
← Move left
→ Move right
↓ Move down

R Colour red
G Colour green
B Colour blue
Y Colour yellow
P Paint an enclosed area
 a chosen colour
O Clear screen
M Cursor on
O Cursor off
S Stop moving
W Move at 315 degrees
E Move at 45 degrees
Z Move at 225 degrees
X Move at 135 degrees
@ End

NB. LINE 330, WHICH WAS INCORRECTLY PRINTED, SHOULD READ: 330 IF GS="Q" THEN X=0:Y=0:PCLS

Program notes

60-240 Prints instructions
260 Switches to graphics screen
290 Reads keyboard
300-470 Carries out input function-graphics screen maintained at all times
480-530 Draws the line on the screen
550-590 Draws cursor on screen, resets old position of cursor
610-730 Subroutine for painting an area a chosen colour

Bingo

on Spectrum

This program is in two parts. The latter will

print bingo cards on the ZX printer, and is linked within the main loop.

The program is well documented with Rem statements, and will run on a 16K Spectrum.

Basically there are two routines: 5000 which operates the printer and 100-320 which is the main loop.

It is quite a simple program which should provide entertainment for all the family.

```

THE BEST AT £7.95

Guaranteed able to consistently beat Sargon II and all other Spectrum chess programs!!

Six levels of play: Plays a variety of openings e.g. French Defense, Sicilian Defense, Ruy Lopez, Queen's Gambit etc
Self Play Mode: Analyse Mode: Enhanced end-game play:
Recommended move option

SOFTWARE
Spectrum
software

●● ORIGINAL SUPERCHES ●● The Cheapest

10 levels of play: recommended move option: substantial opening book e.g. French Defense, Queen's Gambit, Ruy Lopez etc. Self play feature: analyse mode.

49k Spectrum £4.95

16k ZX81 £4.35

●● BACKGAMMON ●●

Play this fascinating game of skill and chance. High resolution colour display with dice roll. Can be used by expert players and also has documentation to enable beginners to learn the game.

48k Spectrum £5.95

●● ZX DRAUGHTS ●●

With its 10 levels of play, ZX Draughts is the ideal game for the beginner or expert player.

48k Spectrum £6.95

●● SPECTRUM FORTH ●● NEW!!

FORTH - 10 times faster than Basic, much easier than machine code. If you want to discover the advantages of Forth or are already converted, Spectrum FORTH is the ideal package. The package is cassette based and includes Spectrum Forth, a sample Forth program and comprehensive user documentation. It has all Forth structures and allows full use of the Spectrum's colour, hi-res, graphics. Specify 16k or 48k when ordering. 16k version, about 115 new words can be defined. 48k version, about 1200 new words can be defined.

16k Spectrum £9.95

48k Spectrum £9.95

●● SPECTRUM SPEECH ●●

Yes it's possible! Software driven speech from the Spectrum. Simple to use in your own programs. Each cassette comes with user documentation and demonstration program. No extra hardware is required. Uses Spectrum speaker and top 32k Ram.

SOFTALK I: 'Multiwords' 70 plus words, numbers zero to million, plus, go, limit, right, great etc. 48k Spectrum £6.95

SOFTALK II: 'Spacegames' 80 plus words, numbers, red alert, torpedoes, phasors, bearing south etc. 48k Spectrum £6.95

●● SPECTRUM BRIDGE TUTOR ●● NEW!!

Improve your Bridge with the Spectrum Bridge Tutor. Uses the Acol bidding system including Blackwood and Stagnan conventions. Each of the 40 hands illustrates a particular point(s) in the bidding and play. After playing a hand you are given an explanation of the main points of the bidding and play. The correct bid and play must be made to progress but if you need assistance there is a help feature.

For 16k and 48k Spectrum

Beginners (40 hands) £5.95

Advanced (40 hands) £5.95

Sing

on Vic20

The program was written for the unex-

panded Vic. It plays the well known song "I'd like to teach the world to sing" (in perfect harmony). The program uses two part harmony in soprano and alto clefs. The alto giving the bass walking pedal effect which I found to be quite realistic.

- line 100 sets the volume
- line 120 determines if the tune has been played three times as three-quarters of the song is the same tune
- line 130 determines if it is the end of the song or not
- the data lines give the values to be 'poked' in order to give sound generation

Hypnotic

on Vic20

The second program creates an impressive screen display. The program uses four

of the Vic control registers to alter the position and size of the screen. They are:

- Poke 36864,0-255 controls start of screen from the top
Poke 36865,0-255 controls start of screen from the left

Poke 36866,0-255 number of columns on screen

- Poke 36867,0-255 number of rows on screen
- lines 1010-1070 make the screen smaller
 - lines 2010-2070 make the screen larger
 - lines 3000-3030 create random reverse fielded spaces which change within the two main sub-routines.

SINCLAIR OWNERS READ THIS FROM

You've probably heard about MACHINE CODED PROGRAMS and thought "so what? How can they help me?"

Well now you can find out and taste the very real difference by purchasing our latest MACHINE CODED programs. These emulate features of the most modern professional computers (12 years) writing machine coded programs for IBM, ICL, UNIVAC and Sinclair means we know what we're talking about.

Just read the specification and you'll see what we mean.

MACHINE CODE TEST TOOL

The ultimate professional tool and debug program, we wrote this to help us write our own programs.

The original Turk was an eighteenth century automaton, a life-size mechanical figure residing in Turkish costume and seated behind a wooden cabinet on which a chess board and pieces were placed.

OCF now offer you the twentieth century equivalent of that Turk — a chess-playing computer program.

The Turk challenges you to a game of chess!

SPECTRUM CHESS? Dare you face The Turk?

Available for the 16K ZX81 and 164K Spectrum.

MANY OPTIONS INCLUDE:

- * 8 LEVELS OF DIFFICULTY
- * DEMONSTRATION MODE
- * BOARD EDITOR
- * GAMES PRINTOUT FACILITY
- * BLITZ CHESS AGAINST THE CLOCK
- * TWO PLAYER MODE
- * UNFINISHED GAMES CAN BE STORED
- * RECOMMENDED MOVE

FULL INSTRUCTIONS PROVIDED

ADDRESS MANAGER.....

Works on the 16K and 48K Spectrum, in 48K it will store, file, select and retrieve over 400 full addresses (over 1500 individual names). Dynamic Memory Management and compression techniques makes all this possible and there's a lot more.

- * **FULL SCREEN INPUT AND EDITING** — see it as a page as it happens with insert, delete and TAB commands
- * **MULTIPLE INDEXING** — 3 way user-defined index enables you to define, catalogue, select and print entries as needed (essential for the more sophisticated applications)
- * **INSTANT RESPONSE** — yes, this program is very fast
- * **SUPER FRIENDLY** — crash-proof, extremely easy to use and efficient in a way that BASIC can never be.

MANY USES

- * **AT HOME** — (storing addresses, printing out Xmas Card lists etc.)
- * **AT WORK** — for mail-order work, internal telephone directory, sorting customers into types, areas, size etc.
- * **CLUBS** — print out members list, sort different categories etc.

MACHINE CODE... IT MAKES ALL THE DIFFERENCE.....

Tony Bridge's Adventure Corner

World of fantasy

The Midnight Programmers, after the day's concentrated toil at designing their new machines, would finally relax and lose themselves in a world of fantasy. Adventure had swept through American computers since its beginnings several years before, and was now standard fare on large company mainframes. With computer time so expensive, management would eventually ban the use of their hardware for this pastime, but for now, it captivated the minds of the programmers.

Drawing heavily on *Dungeons and Dragons*, a role-playing game devised by Gary Gygax and Dave Arneson in the early 1970's, adventures (the plural was later dropped) was originally written in Fortran. As microcomputers became more and more common, so adventure was adapted for their use.

The original format of the game has remained the same to this day, although there are now also many variants. A couple of weeks ago I started a game on a mainframe, a PDP-11/24, which I have asked your help in solving — this will, I hope, give you an idea of some of the flavour of the original, which is as powerful now as it was then.

Blind Alley

Blind Alley is a game of strategy. In order to win you must outwit the computer, using your craft to fence in and finally destroy the enemy pursuit vehicles. But, watch out for the solid trail left by your opponents — one touch is fatal!

Each month *Popular Computing Weekly* is giving away £10 to the player with the highest score on *Blind Alley*. To enter this month's competition simply send in a copy of your score and the code at the bottom of the score table, together with your name and address, to:

Popular Computing Weekly
Blind Alley
Hobhouse Court
19 Whitcomb Street
London WC2 7HF.

Entries for this month's competition close on May 31.

■ *Blind Alley* for the 16K and 48K ZX Spectrum is available through W. H. Smith and leading computer stores for £4.95. It is also available mail-order from Sunshine Books, Hobhouse Court, 19 Whitcomb Street, London WC2 7HF.

Throughout all the variations, however, be they graphic, text, or a mixture of both, the basic idea is still to solve a series of riddles or conundrums, while doing battle with various unsavoury monsters. In the original, all this took place in some unspecified network of catacombs, but authors now feel the need to site their adventures in ever more exotic locations, or, as in Melbourne House's *Hobbit*, to base their programs on existing works of fantasy.

Next week, I will discuss some of the well-tried methods and techniques for getting through the game — though many of you may not believe that there is any system to this frustrating pastime!

In the meantime, can anyone help Paul of the YMCA, Birmingham? He is stuck in *Mission Impossible* for the Vic20, written by good old Scott Adams, of whom more later. Entrance to the power room seems to be causing a problem for Paul, and he would appreciate any help — just drop me a line and I will pass on any tips you might have.

If you are a Vic20 adventure fan, you might also be able to pass along some hints for Ian Bingham, of Merseyside, who is playing *Moon Base Alpha*. He is trying to launch a missile at a comet that is on a collision course for the Base. How does he power up the computer, is what he would like to know.

Adventureland, again for the Vic20, has Tresco Richards completely stuck, trying to get past the bear to the treasure. Giving *Golden Honey* to the bear makes him fall

asleep, but Tresco can't get the *Honey* back, which is a shame, as it is also *Treasure!* Help, please.

And don't forget — *adventuring is not just a load of Kobolds!*

● Many of you have asked in your letters if there are certain words or techniques to be used in adventuring on computers. Well, yes — there are several that have become fairly standard throughout all the versions available. This is an occasional corner to give the adventure dictionary an airing. The first word is one that everybody uses, some more than others: Help.

Type *Help* when you are really stuck, and the computer should (Ho! Ho!) come back with some clue or hint for you. If the author feels benevolent, it will help, but more than likely, the clue will be rather obscure and probably just another problem to be solved. Work this one out, however, and you are on your way to the next location.

This series of articles is designed for novice and experienced Adventurers alike. Each week Tony Bridge will be looking at different Adventures and advising you on some of the problems and pitfalls you can expect to encounter. So, if you have an Adventure you want reviewed, or if you are stuck in an Adventure and cannot progress any further, write to: Tony Bridge, Adventure Corner, *Popular Computing Weekly*, Hobhouse Court, 19 Whitcomb Street, London WC2 7HF.

Cruising Challenge

£10 to be won

Can you beat the new high score?

First there was *Space Invaders*, then there was *Pacman* — now there is *Cruising*. This action, machine code, arcade type game, will test your powers of co-ordination to the limit. Never before has a game asked you to think so quickly, or move so fast.

Achieving a high score on *Cruising* takes considerable skill, and not a little practice. Getting through the first four levels is not easy, and that's just the beginning.

Now you can make that skill work for you. *Popular Computing Weekly* is offering £10 each month to the player with the highest score on *Cruising*. All you have to do to enter this month's competition is send a print-out of your highest score, together with your name and address, to: *Popular Computing Weekly*
Cruising Challenge
Hobhouse Court
19 Whitcomb Street
London WC2 7HF

Each month we will publish the name of the winner and the new *Cruising* high score. Are you good enough to accept the *Cruising Challenge*?

The highest score sent in so far this month is 8244 from Neil Saloway of 31 Avenue Road, Walford, Dorset. If you have a higher score, you could still win this month's £10 — but hurry, entries close on April 30.

Notes

- 1) Each entry must consist of a ZX printout and your name and address.
- 2) Closing date for this month's *Cruising Challenge* entries is April 30.
- 3) The highest score each month will receive £10.
- 4) High scores cannot be transferred from one month to another.
- 5) The judges' decision is final.
- 6) No employees of Sunshine Publications Ltd, or their families, will be eligible to enter the *Cruising Challenge*.
- 7) *Cruising (on Broadway)* for the 16K and 48K ZX Spectrum is available through W. H. Smith and leading computer stores for just £4.95. It is also available mail-order from Sunshine Books Ltd, Hobhouse Court, 19 Whitcomb Street, London WC2 7HF.

VIC20 plus cassette unit, £100-£200. Tel: Woking (0462) 70318.

LINKED UP NETWORK

Ruth Selby of York, writes:

Q I have a Vic20 and I am getting on quite well when it comes to learning how to program. I have seen a number of advertisements and articles mentioning Micronet, a system for linking up ordinary home computers to a Prestel network, that will carry programs for the home user. It seems that it can be used with the Sinclair computers and some others.

What others? Could you please give me some more details, especially about the Vic20?

A Micronet has a policy of steadily adding new computers to the Micronet system. It is a telephone accessed database, and each computer will need its own modem and decoding software. It is planned to bring the Vic20 on line in July this year. The Commodore 64 will also be bought on line later this year.

WHICH COMPUTER?

Gary Wilinson of Wilford Gardens, Chelsea SW3, writes:

Q I am thinking of buying a computer, but am not sure which one to buy. The two which interest me are the BBC model B and the Atari 800 (48K). I am not only interested in games, but learning to program in Basic and Machine code as well. Please could you give me some idea of the capabilities of these machines.

A You have chosen two machines that are very much in the same corner of the market and are now in a similar price range. The Atari will give you more user memory and its excellent graphics are well known. The BBC is generally considered to be

able to mount at least a challenge to the Atari on the graphics front, though it does not have quite the same variations of colour. Neither will the BBC have as much Ram free for your own use.

On the other hand, the BBC is probably the best micro under £500 when it comes to additions to the system, including the potential of the 'tube' by which a second processor can be added. There will be more potential to build a complete system around the BBC.

The question of support is fraught with difficulties and cannot easily be dealt with here. Firstly, if you are at school, then the BBC is one of the most common computers chosen under the D.I. scheme. A lot of independent companies are making software for it, and the software tends to be cheaper than comparable Atari programs.

What it comes down to is looking not only at the computers, but at what is available for them, and the overall cost. Also, work out as far as possible how much you want to develop your system.

CHEAPER AND EASIER?

R Baker of Goole in Humberside, writes:

Q I have been working through Toni Baker's book *Mastering Machine Code on your ZX81* and find it excellent. I would like to know if there is a book available that will give the Z80 instruction set. I know of the Rodney Zak book, but I wonder if there is anything cheaper and more straight forward?

A Though Rodney Zak's tome is very much a standard work, I can understand people struggling in places. I can also appreciate your reluctance in paying £12 for a book that is difficult to comprehend.

However, cheaper alternatives do not readily spring to mind, with the exception of an excellent little book, that perversely seems to be very difficult to find. The *Z80 Instruction Handbook* is by Nat Wadsworth and is published by Scelbi. I have no ISBN number in my copy nor a library of congress catalogue number.

Georges do not have it listed in their catalogue and I do not think that Foyles have any more copies — as I said, the book is elusive. There is at least one in the library system, or you might try contacting Scelbi direct. The address is 20 Hurlbut Street, Elmwood, Illinois, CT06110, USA. Good luck.

ORIC QUESTIONS

C Dawson of Buttermere Drive, Allestree, Derby, writes:

Q I am thinking of buying an Oric 1. Having read some recent reviews, the following questions come to mind. It appears that the Oric will be able to accept Telesoft programs — does this mean that it will be able to download programs from Ceefax?

Since Telesoft is designed for the BBC micro, will the BBC programs be compatible with the Oric 1 (entered as listings or from tape)? Also, will *Popular Computing Weekly* be publishing programs for the Oric?

A The Oric was designed to download Prestel through its own modem — unfortunately this modem seems to have been 'delayed'.

To download Ceefax, a special adaptor will be needed and I do not know if one is yet available for the Oric.

At least Ceefax now has a standard, set by the CET (Council for Education Technology). This means that you will need a standard Ceefax adaptor, plus special software to decode the input into the Oric's own dialect of Basic. Again, I do not know if this is being done.

The Oric cannot Load BBC programs and a BBC program would have to be translated from the Oric's microsoft version of Basic to the BBC's lookalike version.

We are always on the look out for good programs, whatever the computer. Interest in the Oric is growing and I hope that good material will be available soon.

SPECTRUM PRINTERS

Cameron Smith of West Hill Road, Dartford, Kent, writes:

Q I wonder if you can help me. I would like to buy a colour printer for my ZX Spectrum (48K). Will the Tandy graphic colour printer CGP-115 be compatible? Will Tandy supply an interface for use with my Spectrum? Do you know how reliable it is and where I can contact the dealers?

A I am not an electronic expert and I would appreciate any other advice you have about printers and prices for the Spectrum.

The Tandy colour graphic printer is certainly an important addition to the range of printers available at the lower end of the market. The CGP-115 will not be directly compatible with the Spectrum, as the Spectrum does not have either a Centronics, or an RS 232 interface.

However, Soptest, 10 Richmond Lane, Romsey, Hants, has developed a package which enables the Spectrum to run the CGP-115. The package costs £35 and includes both connector and software to run the system. For further details see News Desk, March 31-April 6.

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem *Peek* it to Ian Beardsmore and every week he will *Poke* back as many answers as he can. The address is *Peek & Poke*, PCW, Hobhouse Court, 19 Whitcomb Street, London WC2 7HF.

Ziggurat

Sweet and Sour

Some American psychologists have developed a technique to quantify a human response called the method of "semantic differentials".

A semantic differential is a bipolar scale such as "hot ... cold", "big ... small" or "expensive ... cheap" applied to a set of concepts. A concept can be an object such as "the Mini Metro", or an idea such as "justice", and the same scales are used for a whole series of concepts.

The psychologists found that people were quite willing to engage in this exercise, to the extent that they were willing to rate "boulders" (ie, big rocks) on scales such as "sweet ... sour". That is, people were able to rate boulders as more sour than sweet, without being too sour. When I see some reviews of software, or hardware, I think of the boulder being sweet or sour, or scoring 5.7 on the sweet ... sour scale (very sweet=1, very sour=7).

Take, for example, a list of different computers, by price. The list has a large number of categories, such as "memory", "languages", and such like — with some useful information within the categories. The final category is "ratings", where the sub-categories are "games", "business", "scientific", "program", and "overall". Each sub-category has a number from 1 to 10. One series of numbers is 3,5,4,4, with 4 being the score for the overall rating; another series is 4,6,4,4, still with an overall

score of 4; yet one with 2,6,3,4, has an overall score of 5.

Numbers are used because they give a touch of (non-existent) objectiveness to the whole exercise.

In fact, they say no more (perhaps less) than good old-fashioned "excellent" or "terrible". The compilers of the list are trying to quantify the unquantifiable, because numbers seem to carry greater weight than words — they appear more professional.

In another example (from a different source), games could be rated on a percentage basis and given an overall stars-rating. The variation in the use of stars seemed to indicate that the most popular classification was four stars. Why not just say "very good"?

I am very interested in words, and I found the written commentary to be at variance with the percentages, which themselves seemed to have little relationship with the star appraisal.

The fascination with numbers has also extended to advertisers. I have seen one which proudly claims that this certain program had the greatest combined score (the review had several scales, all marks out of 5) for programs of that type.

This is a bit like saying: I have three marbles in my pocket, and two pound notes so I have more than you — because you only have one marble, and three pound notes. To score 6 by getting 4 for enjoyment and 2 for ease of loading, is not the same as scoring 6 by getting 1 for enjoyment and 5 marks for ease of loading.

The evaluation of software requires rather more sophistication than that.

So I have developed my own evaluation system (which is mine and belongs to me) — called the CO4 criteria. The criteria are Communication (how the user and program interact), Computation (how does the program do what it does, and should it?), Co-ordination (how do the various parts of the program relate?), and finally Constitution (does it make sense?). More of this next week.

Boris Allan

Puzzle

Back to front!

Puzzle No 51

102564

This is an interesting number. Moving the final digit — 4 — from the end of the number to the front the result is exactly four times as big:

$$4 \times 102564 = 410256.$$

This is the smallest number with this property. Can you find the *lowest* number that ends in a '9' which becomes nine times as big if the figure is removed from the end and placed at the beginning.

Solution to Puzzle No 46

As we are told that zero is not used, we need to find a 3-digit number that has a 6-digit square in which all the nine digits involved are different.

The numbers, between 317 and 999, are tested sequentially for this property.

```
10 FOR N = 317 TO 999
20 LET M = N * N
30 LET NS = STR$ N + STR$ M
40 FOR A = 1 TO 8
50 FOR B = A + 1 TO 9
60 IF NS(A) = NS(B) OR NS(A) = "0" OR NS(B) = "0" THEN GOTO 100
70 NEXT B
80 NEXT A
90 PRINT N, N * N
100 NEXT N
```

This gives the results 567 or 854.

Winner of Puzzle No 46

The winner is: Martin McKeown, Carnvue Gardens, Cammoney, Newtownabbey, Co. Antrim, Northern Ireland.
